MATH 355: HOMEWORK 11

ALEXANDER LEE

Exercise 1 (6.3.1). (a) We show that (g_n) converges uniformly on [0,1] to $g = \lim g_n = 0$. Given $\epsilon > 0$, choose $N \in \mathbb{N}$ such that $N > 1/\epsilon$. Then, whenever $n \geq \mathbb{N}$ and $x \in [0,1]$, it follows that

$$|g_n(x) - g(x)| = \left| \frac{x^n}{n} - 0 \right| = \left| \frac{x^n}{n} \right| = \frac{x^n}{n} \le \frac{1}{n} \le \frac{1}{N} < \epsilon.$$

g is differentiable since it is the constant function g(x) = 0 for all $x \in [0, 1]$. Specifically, we have that g'(x) = 0 for all $x \in [0, 1]$.

(b) By the Algebraic Differentiability Theorem, we have that

$$g'_n(x) = \frac{n(nx^{n-1}) - x^n(0)}{n^2} = x^{n-1}.$$

It follows that (g'_n) converges on [0, 1] to

$$h(x) = \lim g'_n(x) = \begin{cases} 0 & \text{if } 0 \le x < 1 \\ 1 & \text{if } x = 1 \end{cases}$$
.

By the contrapositive of the Continuous Limit Theorem, since h is not continuous and g'_n is continuous on [0,1], we have that (g'_n) does not converge uniformly on [0,1] to h. Observe that h and g' are not the same.

Exercise 2 (6.3.2). (a) The pointwise limit of (h_n) is $h(x) = \lim \sqrt{x^2 + \frac{1}{n}} = \sqrt{x^2} = |x|$. To show that the convergence is uniform on \mathbb{R} , let $\epsilon > 0$ be arbitrary and choose $N \in \mathbb{N}$ such that $N > 1/\epsilon^2$. Then, whenever $n \geq N$ and $x \in \mathbb{R}$, it follows that

$$|h_n(x) - h(x)| = \left| \sqrt{x^2 + \frac{1}{n}} - |x| \right| \le \left| \sqrt{x^2} + \sqrt{\frac{1}{n}} - |x| \right|$$
$$= \left| |x| + \sqrt{\frac{1}{n}} - |x| \right| = \sqrt{\frac{1}{n}} \le \sqrt{\frac{1}{N}} < \epsilon.$$

(b) By the Chain Rule, we have that

$$h'_n(x) = \frac{1}{2\sqrt{x^2 + \frac{1}{n}}} \cdot 2x = \frac{x}{\sqrt{x^2 + \frac{1}{n}}}.$$

For $x \neq 0$, it follows that

$$g(x) = \lim_{n \to \infty} h'_n(x) = \lim_{n \to \infty} \frac{x}{\sqrt{x^2 + \frac{1}{n}}} = \frac{x}{\sqrt{x^2}} = \frac{x}{|x|} = \begin{cases} -1 & x < 0\\ 1 & x > 0 \end{cases}.$$

For x = 0, we have

$$g(0) = \lim h'_n(x) = \lim \frac{0}{\sqrt{0^2 + \frac{1}{n}}} = 0.$$

Thus, g(x) exists for all x. Observe that g(x) is not continuous at x = 0 but each $h'_n(x)$ is continuous at x = 0. Therefore, by the contrapositive of the Continuous Limit Theorem, it follows that $h'_n(x)$ does not converge uniformly on any neighborhood of zero.

- **Exercise 3** (6.4.2). (a) True. Given that $\sum_{n=1}^{\infty} g_n$ converges uniformly, it follows from a special case of the Cauchy Criterion for Uniform Convergence of Series that that given $\epsilon > 0$, there exists an $N \in \mathbb{N}$ such that whenever $m \geq N$ and $x \in A$, where A is the domain of g_n , we have that $|g_{m+1}(x)| < \epsilon$. Therefore, (g_n) converges uniformly to zero.
 - (b) True. Given that $0 \le f_n(x) \le g_n(x)$ and $\sum_{n=1}^{\infty} g_n$ converges uniformly, it follows from the Cauchy Criterion for Series that given $\epsilon > 0$, there exists an $N \in \mathbb{N}$ such that whenever $n > m \ge N$, we have that

$$|f_{m+1}(x) + f_{m+2}(x) + \dots + f_n(x)| \le |g_{m+1}(x) + g_{m+2}(x) + \dots + g_n(x)| < \epsilon.$$

Therefore, $\sum_{n=1}^{\infty} f_n$ converges uniformly as well.

(c) False. Consider $f_n(x) = (-1)^n \frac{x^n}{n}$. Observe that $\sum_{n=1}^{\infty} f_n(x)$ converges for x=1 by the Alternating Series Test. By Abel's Theorem, it follows that $\sum_{n=1}^{\infty} f_n(x)$ converges uniformly on the interval A=[0,1]. We want to show that for all M_n , there exists an $x \in [0,1]$ such that $|f_n(x)| > M_n|$ or $\sum_{n=1}^{\infty} M_n$ diverges. Fix $x=1 \in [0,1]$ and let M_n be arbitrary. If $|f_n(x)| > M_n$, then we are done. If $|f_n(x)| = \frac{1}{n} \leq M_n$, then $\sum_{n=1}^{\infty} M_n$ diverges by the Comparison Test.

Exercise 4 (6.4.4). Let $g_n(x) = \frac{x^{2n}}{(1+x^{2n})}$. Observe that if $|x| \ge 1$, then $\lim g_n(x) \ne 0$, and so g(x) is not converge for $|x| \ge 1$. Now for any [-c,c] with $c \in (0,1)$, choose $M_n = \frac{c^{2n}}{1+c^{2n}}$. It follows from a variant of the geometric series that

$$\sum_{n=1}^{\infty} M_n = \sum_{n=1}^{\infty} \frac{c^{2n}}{1 + c^{2n}} < \sum_{n=1}^{\infty} c^{2n} = \frac{c^2}{1 - c^2}.$$

Note that $|g_n(x)| \leq M_n$ for $x \in [-c, c]$. By the Weierstrass M-Test, it follows that $g(x) = \sum_{n=1}^{\infty} g_n(x)$ converges uniformly on [-c, c]. Thus, we have that g(x) converges on (-1, 1). For continuity, since g(x) converges uniformly on [-c, c] and each $g_n(x)$ is continuous on [-c, c], it follows from the Term-by-term Continuity Theorem that g(x) is continuous on [-c, c]. Hence, g(x) is continuous on (-1, 1).

Exercise 5 (6.4.5a). Observe that each $\frac{x^n}{n^2}$ is continuous on [-1,1]. Also note that for each $n \in \mathbb{N}$, $\left|\frac{x^n}{n^2}\right| \leq \frac{1}{n^2}$ for all $x \in [-1,1]$. Since $\sum_{n=1}^{\infty} \frac{1}{n^2}$ converges, it follows from the Weierstrass M-Test that $\sum_{n=1}^{\infty} \frac{x^n}{n^2}$ converges uniformly on [-1,1]. Therefore, h(x) is continuous on [-1,1] by the Term-by-term Continuity Theorem.

Exercise 6 (6.5.1). (a) g can be rewritten as the power series

$$g(x) = \sum_{n=1}^{\infty} (-1)^{n+1} \frac{x^n}{n}.$$

If x = 1, then g(x) converges by the Alternating Series Test. By Theorem 6.5.1, it follows that g(x) converges absolutely for any $x \in (-1,1)$. Therefore, g is converges and hence defined on (-1,1).

Since g converges on (-1,1), it follows from Theorem 6.5.7 that g is continuous on (-1,1).

Since g(x) converges at the point x = 1, it follows from Abel's Theorem that g converges uniformly on the interval [0,1]. We established previously that g also converges on (-1,1). Therefore, we can conclude that g converges on (-1,1] and is thus defined on this set.

Since g(x) converges on (-1,1], it follows from Theorem 6.5.7 that g is continuous on this set.

g(x) is undefined for x = -1 since this value of x yields the harmonic series, which does not converge. Thus, g is not defined on [-1,1] and so cannot even be continuous on this set.

The power series for g(x) cannot possibly converge for any other points |x| > 1 because g(x) would be unbounded.

(b) g'(x) is defined on (-1,1), where

$$g'(x) = \sum_{n=1}^{\infty} (-1)^{n+1} \frac{nx^{n-1}}{n} = \sum_{n=1}^{\infty} (-1)^{n+1} x^{n-1},$$

by Theorem 6.5.7.

Exercise 7 (6.5.2). (a) Consider $a_n = \frac{1}{n!}$. We have that

$$\lim \left| \frac{x^{n+1}}{(n+1)!} \cdot \frac{n!}{x^n} \right| = \lim \left| \frac{x}{n+1} \right| = 0 < 1.$$

By the Ratio Test, it follows that $\sum a_n x^n$ converges.

- (b) Consider $a_n = n!$. Since $\lim a_n x^n \neq 0$ for all $x \in \mathbb{R}$, it follows that $\sum a_n x^n$ diverges.
- (c) Consider

$$a_n = \begin{cases} 0 & \text{if } n \text{ odd} \\ 1/(\frac{n}{2})^2 & \text{if } n \text{ even} \end{cases}.$$

Then, $\sum_{n=1}^{\infty} a_n x^n = \sum_{n=1}^{\infty} \frac{x^{2n}}{n^2}$, which converges absolutely absolutely for all $x \in [-1, 1]$ and diverges off this set.

- (d) Impossible. If the power series $\sum a_n x^n$ converges conditionally at x = -1, then we know that $\sum |a_n(-1)^n| = \sum |a_n 1^n|$ diverges. Therefore, the power series cannot converge absolutely at x = 1.
- (e) Consider

$$a_n = \begin{cases} 0 & \text{if } n \text{ odd} \\ (-1)^{\frac{n}{2}} / \frac{n}{2} & \text{if } n \text{ even} \end{cases}.$$

Then, $\sum_{n=1}^{\infty} a_n x^n = \sum_{n=1}^{\infty} \frac{(-1)^n x^{2n}}{n}$, which converges conditionally at both x = -1 and x = 1.

Exercise 8 (6.5.4). (a) We first show that F(x) is defined on (-R, R). Observe that

$$0 \le \left| \frac{a_n}{n+1} x^{n+1} \right| = \left| \frac{a_n}{n+1} \right| |x| |x^n| \le |a_n| |x| |x^n| = |x| |a_n x^n|.$$

We now show that $\sum_{n=0}^{\infty}|x||a_nx^n|$ converges. Recall that f(x) converges on (-R,R). Thus, by Theorem 6.5.1, f(x) converges absolutely on (-R,R). Since $\sum_{n=0}^{\infty}|a_nx^n|$ converges, it follows that $\sum_{n=0}^{\infty}|x||a_nx^n|$ converges. By the Comparison Test, it follows that $\sum_{n=0}^{\infty}\left|\frac{a_n}{n+1}x^{n+1}\right|$ converges. Therefore, F(x) converges on (-R,R) as well by the Absolute Convergence Test. Since F(x) converges on (-R,R), we have that F is differentiable and F'(x)=f(x) by Theorem 6.5.7.

F'(x)=f(x) by Theorem 6.5.7. (b) $g(x)=F(x)+c=(\sum_{n=0}^{\infty}\frac{a_n}{n+1}x^{n+1})+c, \text{ for some } c\in\mathbb{R}.$
